Richard Holden, and Olivier Tercieux

## ABSTRACT

We consider the robustness of extensive form mechanisms to common  $\epsilon$ -belief value perturbations. We show that with even an arbitrarily small amount of such uncertainty, the Moore-Repullo mechanism does not yield (even approximately) truthful revelation and in addition there are sequential equilibria with undesirable outcomes. More generally, we show that any extensive form mechanism is fragile in the sense that if a non-monotonic social objective can be implemented with this mechanism, then there are arbitrarily small common  $\epsilon$ -belief value perturbations under which an undesirable sequential equilibrium exists. Finally, we analyze the implications of these non-robustness results for the hold-up problem and argue that our results restore Grossman and Hart's basic insights on the hold-up problem.
